Police Station points are used by DES (Dept. of Emergency Services) as a reference for both call-taker/dispatch functions as well as for EOC (Emergency Operations Center) related functions/events.

Response Zones are primarily used by DES (Department of Emergency Services) in support of their Enhanced 911 System and emergency call-taker dispatch, as well as for EOC (Emergency Operations Center) related functions/events. The Response Zone data is used in conjunction with Road Centerline data to produce the Geofile output for DES’s Computer Aided Dispatch (CAD) System. EMS data is also used for a variety of general GIS functions, including viewing, querying, spatial analysis, and map production.
