Manifold System

- A manifold system irrigates mushroom wastewater on a treatment strip by dispersing the effluent through a spreader pipe. It is important to remember that the vegetation in the treatment strip must be harvested in order to achieve nutrient removal from the system.

Sprinkler System

- A series of sprinkler heads can be installed to irrigate the mushroom wastewater on a wastewater treatment strip. It is important to remember that the vegetation in the treatment strip must be harvested in order to achieve nutrient removal from the system.

Constructed Wetlands

- It is possible to use a constructed wetland as part of an agricultural waste management system in order to reduce the nutrient content of the wastewater. In most cases, the effluent from the wetland will still need to undergo further treatment.
